

Features

- Adjust Color Temperature Continuously
- Adjust Intensity and Color Temperature Separately
- 40W Max Each Channel with Total 40W Load
- 1% Min Each Channel with Total 10% Min Dimming
- Full Power at Wide Output Current Range (Constant Power)
- Adjustable Output Current (AOC) with Programmability
- Isolated 1-5V/1-10V/10V PWM/3-Timer-Modes Dimmable
- Flicker Free
- Output Lumen Compensation
- Input Surge Protection: DM 4kV, CM 6kV
- All-Around Protection: OVP, SCP, OTP
- IP66/IP67 (DV model)
IP66 and UL Dry/Damp Location (DF model)
- SELV Output
- TYPE HL, for Use in a Class I, Division 2 Hazardous (Classified) Location
- 5 Years Warranty

Description

The EUW-040DxxxDx series is a 40W, constant-current, programmable IP66/IP67 LED driver that operates from 90-305Vac input with excellent power factor. Created to enhance tunnel, low bay, signage, or wall pack type applications by offering a simplified white color tuning solution. The high efficiency of these drivers and compact metal case enables them to run cooler, significantly improving reliability and extending product life. To ensure trouble-free operation, protection is provided against input surge, output over voltage, short circuit, and over temperature.

Protection Functions

Parameter	Notes
Over Temperature Protection	Decreases output current, returning to normal after over temperature is removed.
Short Circuit Protection	Auto Recovery. No damage will occur when any output is short circuited. The output shall return to normal when the fault condition is removed.
Over Voltage Protection	Limits output voltage at no load and in case the normal voltage limit fails.

Dimming

1-5V Dimming

The recommended implementation of the dimming control is provided below which shows **total** output current in dimming voltage related diagram and I1(black), I2(blue) distribution in CCT voltage related diagram based on full power.

Implementation 1: Positive logic

Implementation 2: Negative logic

Notes:

1. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.
2. The dimmer can also be replaced by an active 1-5V voltage source signal.
3. When 1-5V negative logic dimming mode and Dim+ is open, the driver will output maximum current.

● 1-10V Dimming

The recommended implementation of the dimming control is provided below which shows **total** output current in dimming voltage related diagram and I1(black),I2(blue) distribution in CCT voltage related diagram based on full power .

Implementation 3: Positive logic

Implementation 4: Negative logic

Notes:

1. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.
2. The dimmer can also be replaced by an active 1-10V voltage source signal.
3. When 1-10V negative logic dimming mode and Dim+ is open, the driver will output maximum current.

● 10V PWM Dimming

The recommended implementation of the dimming control is provided below which shows **total** output current in PWM duty cycle related diagram and I1(black),I2(blue) distribution in CCT voltage related diagram based on full power .

Implementation 5: Positive logic

Implementation 6: Negative logic

Notes:

1. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.
2. When 10V PWM negative logic dimming mode and Dim+ is open, the driver will output maximum current.

● Dim/CCT Time Dimming

Time dimming control includes 3 kinds of modes, they are Self Adapting-Midnight, Self Adapting-Percentage and Traditional Timer.

- **Self Adapting-Midnight:** Automatically adjusts the dimming curve based on the on-time of past two days (if difference <15 minutes), assuming that the center point of the dimming curve is midnight local time.
- **Self Adapting-Percentage:** Automatically adjusts the on-time of each step by a constant percentage = (actual on-time for the past 2 days if difference <15 min) / (programmed on-time from the dimming curve).
- **Traditional Timer:** Follows the programmed timing curve after power on with no changes.

● Output Lumen Compensation

Output Lumen Compensation (OLC) may be used to maintain constant light output over the life of the LEDs by driving them at a reduced current when new, then gradually increasing the drive current over time to counteract LED lumen degradation.
