

The IT 0-10 320/100-277/N series is a 320W, constant-current and IP20 rated LED driver that operates from 90-305Vac input with excellent power factor. Created for area lighting application, this family provides an auxiliary voltage and dim-to-off functionality for powering low voltage sensors. The dimming control supports 0(1)-10V, PWM dimming, resistor dimming, and AstroDIM dimming. The high efficiency of these drivers and compact metal case enables them to run cooler, significantly improving reliability and extending product life. To ensure trouble-free operation, protection is provided against input surge, output over voltage, short circuit, and over temperature.

### Features

- Non-Isolated Design with Low Residual Output Voltage < 2 kV
- No Afterglow on Specific Models
- Ultra High Efficiency (Up to 97%)
- Full Power at Wide Output Current Range (Constant Power)
- Adjustable Output Current (AOC) with T4T(Tuner4TRONIC)
- Isolated 0(1)-10V/PWM/Resistor/AstroDIM(Timer) Dimmable
- Dim-to-Off with Standby Power  $\leq 0.5$  W
- Adjustable Dimming Curve
- Always-on Auxiliary Power: 12Vdc, 200mA
- End-of-Life Indicator
- Override Dimming
- Constant Lumen
- Additional port (BM+) for current setting via external Dip Switch
- Additional port (OP+) for external Light Sensor on Specific Models
- Input Surge Protection: DM 6kV, CM 6kV
- All-Around Protection: OTP, OVP, SCP
- 5 Years Warranty

### Application

- IP20 Design and Suitable for Outdoor Applications in Luminaires with IP>54
- Suitable for Luminaires with Protection Class I
- Suitable for Built-in Use

## Certificates & Standards

Safety Category	Standard
UL/CUL	UL 8750, CAN/CSA-C22.2 No. 250.13
FCC Part 15	ANSI C63.4 Class B
	This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: [1] this device may not cause harmful interference, and [2] this device must accept any interference received, including interference that may cause undesired Operation.
ENEC	EN 61347-1, EN 61347-2-13, EN IEC 62384
CE	EN 61347-1, EN 61347-2-13, EN IEC 55015, EN 61547, EN IEC 61000-3-2, EN 61000-3-3

## Protection Functions

### Over Temperature Protection(OTP)

Protection based on safety: decreases output current if maximum internal temperature is reached, returning to normal value after over temperature is removed.

When output current reaches 20%, switch-off until over temperature is removed.

### Driver Guard

Default setting: disabled.

Protection based on lifetime: It can be activated via T4T. Set a lower internal temperature threshold (Thermal Settings: reduce the temperature threshold by 5°C, 10°C, 15°C or 20°C) to activate the over temperature protection.

## Dimming

### Adjustable Dimming Curve

0-10V curve can be set as corresponding dimming voltage by T4T. Take the 0-10V positive logic dimming mode as an example, the recommended implementation of the dimming control is provided below:

#### Notes:

1. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.
2. The dimmer can also be replaced by an active 0-10V voltage source signal or passive components like zener.
3. When dimming voltage X point is set to be smaller than Y point, the dimming curve is positive logic; conversely, when X point is set to be bigger than Y point, the dimming curve is negative logic.
4. For best dimming accuracy, the difference between X point and Y point is advised not less than 4V.

### 0(1)-10V Dimming

The recommended implementation of the dimming control is provided below:

The driver is protected against temporary overheating by automatically reduction of the output current.

### Over Voltage Protection(OVP)

Limits output voltage at no load and in case the normal voltage limit fails.

### Short Circuit Protection(SCP)

Auto Recovery. No damage will occur when any output is short circuited. The output shall return to normal when the fault condition is removed.

#### Notes:

1. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.
2. The dimmer can also be replaced by an active 1-10V voltage source signal or passive components like zener.

### PWM Dimming

The recommended implementation of the dimming control is provided below:

#### Notes:

1. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.
2. When PWM negative logic dimming mode and Dim+ is open, the driver will dim to off and be standby.

## Resistor Dimming

The recommended implementation of the dimming control is provided below:

### Notes:

1. Do NOT connect Dim- to the output V- or V+, otherwise the driver will not work properly.

## AstroDIM(Timer)

AstroDIM (Timer) includes 2 kinds of modes, they are Astro Based and Time Based.

- **Astro Based:** The benchmark for the dimming profile is based on the average midnight each year, which is precisely calculated using

theoretical sunrise and sunset times. The LED driver strictly adheres to daily power-on and power-off times to execute the corresponding dimming configuration file. Furthermore, the adjustment of the dimming schedule is dynamic, automatically adapting according to the actual length of the night to ensure that the lighting effect aligns with nighttime environmental needs.

- **Time Based:** The dimming profile defined in the reference schedule is referenced to the switch-on time of the LED driver.
- **Override Dimming:** When the integrated "AstroDIM(Timer)+Override" is enabled, it is possible to override the dimming mode from 'AstroDIM' into 'Adjustable Dimming Curve' mode by applying a voltage of 1(0)-10V between DIM+ and DIM-. Once a voltage  $\leq 10.5$  Vdc is detected the output current will coincide with the dimming voltage. By opening the DIM+ and DIM- circuitry, the LED driver will switch again to AstroDIM mode. During override, our product continues to count while the AstroDIM is being overridden. Once the override is removed, the output current returns to the same point in its AstroDIM cycle.

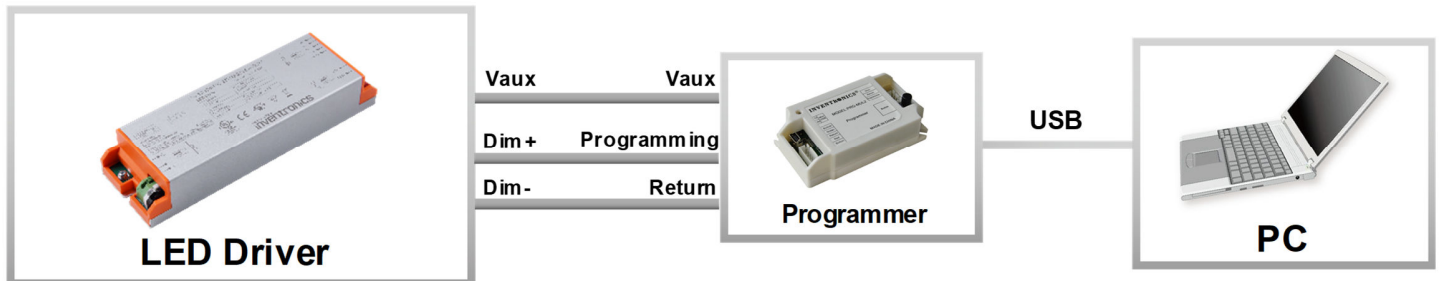

## Constant Lumen

Constant lumen function may be used to maintain constant light output over the life of the LEDs by driving them at a reduced current when new, then gradually increasing the drive current over time to counteract LED lumen degradation. This function is disabled by default.

## End Of Life

End-of-Life (EOL) is providing a visual notification to a user that the LED module has reached the end of manufacturer-specified life and that the replacement is recommended. Once active, an indication is given at each power-up of the driver, which the driver indicates this through a lower light output (minimum output current level) during the first 10 minutes before normal operation is continue.

## Programming Connection Diagram

- Note:** (1) The driver does not need to be powered on during the programming process.  
 (2) Please refer to [PRG-MUL2](#) (Programmer) datasheet for details.  
 (3) Supports **T4T** functionality.
